

# 4G FAILOVER FOR VOIP

## What Is 4G Failover?

4G failover is a backup internet connection that automatically activates when your primary broadband goes down.

Using mobile data via a 4G SIM, it keeps your VoIP phone system online so your team can continue communicating without disruption.

## Why It Matters For VoIP

VoIP systems rely entirely on internet connectivity.

If your broadband drops, so do your calls. With 4G failover, your system switches seamlessly to mobile data, maintaining call quality and uptime.

## The Benefits

### Uninterrupted Comms

Your VoIP system stays online even if your broadband doesn't.

Whether it's a power cut, a line fault, or a provider issue, 4G failover ensures your phones keep ringing and your team stays connected.

### Auto Switchover

No manual intervention needed. Our routers detect the outage and switch to 4G instantly - so your team won't even notice the change.

### Crystal Clear Quality

We use high-quality mobile networks and enterprise-grade hardware to maintain excellent call clarity, even during failover.

### Cost-Effective Protection

Downtime can cost thousands in lost productivity and missed opportunities. 4G failover is a low-cost insurance policy for your communications.

# FLEXIBLE NETWORKS

Before deployment, we check which mobile network offers the strongest and most reliable 4G signal in your area.

This ensures your failover connection is fast, stable, and ready when you need it most.

## Setup & Cost

Setting up a 4G failover network for your business is a smooth, non-disruptive process and costs just £80 – excluding the monthly data plan.

## ENSURE YOUR CONNECTIVITY WITH 4G FAILOVER
